TITLE: Effect of substrate temperature on the macro- and microstructure of thin cadmium telluride film

SOURCE: Ref. zh. Fizika, Abs. 9A400

REF SOURCE: Lit. fiz. sb., v. 5, no. 4, 1965, 495-502

TOPIC TAGS: cadmium telluride, thin film, ~~thin film~~ ^{grain} structure, ~~thin film~~ ^{metal} film, ~~macrostructure~~, ~~substrate temperature~~, ~~thin film structure~~, ~~thin film~~ ^{growth}, ~~mechanism~~, polycrystalline film, ^{high temperature effect} ~~crystal~~

ABSTRACT: A study was made of the parameters of the macro- and microstructure of sputtered thin CdTe film as a function of substrate temperature (T_n) within the 120—245C range. Two substantially different structural regions, separated by a narrow transitional area with the point of separation at $T_n \approx 185C$, were identified in the film on the basis of several factors: the nature of the relationship between the parameters of the distribution curve for the area of the film's visible structure in relation to the grain size of the crystals (maximum distribution func-

Card 1/2

ACC NR: AR7000835

tion values, distribution curve half-widths), the mean crystal grain area values, the effective CdTe accommodation coefficient, the texture parameters, and the correlation between the cubic and hexagonal phases of the film as a function of T_n . It was found that the causes of such a sharp demarcation in the structure of the film as a function of T_n are the conditions for the condensation of Te, which determine the mechanism of the growth of the CdTe layer as a whole. A model of the mechanism of the growth of the CdTe film is given. [Translation of abstract]

TITLE: Comprehensive investigation of thin films of cadmium telluride containing the elements of the first and third group as impurities. 1. Electromicroscopic study of cadmium telluride film structure as a function of the concentration of copper and the temperature of the substratum.

SOURCE: AN LitSSR. Litovskiy fizicheskiv sbornik, v. 4, no. 2, 1964, 267-274

TOPIC TAGS: cadmium telluride film, film structure, copper, film deposition, electron microscopy, impurity concentration

ABSTRACT: The article considers the characteristics of the growth of CdTe films when the alloying of the film is carried out by the independent evaporation of CdTe and the impurity - copper. The purpose of this work was to determine the dependence of the film structure on the concentration of the introduced copper, and to determine the limiting active concentration of copper in the CdTe film. The study was carried out by means of electron microscopy and optical investigations of the impure CdTe films. The structure of the film obtained at different substratum tem-

2

peratures was investigated as a function of the concentration of copper ranging from 10^{15} to 10^{21} cm⁻³. It was established that the layers obtained on a cold substratum up to room temperature are greatly disordered and have no pronounced structure. With increasing concentration of copper their visible substructure is smoothed out. The films obtained on substrata heated to 150 and 250°C have a pronounced structure. As the temperature increases the crystal size also increases. It was established that structure size increases at high concentrations of copper. It was established that the limiting concentration of active copper does not exceed 10^{21} cm⁻³. It was found that the impurity phase is concentrated predominantly on the surface of the film. The optical studies were carried out by A. P. Jaks. Griz. art. has 5 figures.

TOPIC TAGS: spectral sensitivity curve, effective wavelength, ¹² photometric system, tricolor photometric system

ABSTRACT: Calculations were made of the spectral-sensitivity curves and of the effective wavelengths for ultraviolet, blue, and yellow values, obtained on the 48-cm reflector at the Vil'nyus observatory. On the basis of theoretical and empirical observations of the accumulation of NGC 129, the reducing relationship between the Vil'nyus values of U_{vl}, B_{vl}, and V_{vl} and the values of U, B, and V was established. The theoretical and empirical equations of the relationship for blue and yellow values are in good agreement. The theoretical calculation for ultraviolet

Title: Investigation of Destructive Action of Calcareous Inclusions in
Ceramic Body

Original

Periodical: Kauno politechn. inst. darbai, Tr. Kaunassk. politekhn. in-ta,
1955, 3, 51-60; Lithuanian; Russian resumé

Abstract: To prevent destructive action of calcareous inclusions in clay
bricks ("dutijs") it is recommended to wet the bricks by immersion
in water for 15 minutes or by vigorous spraying with water which
is more effective. The recommended procedure is effective with
calcareous inclusions of dimensions up to 7-8 mm.

Renev, I.I., Vyazova, I.Ya., Chistova, G.Ya., Chistova, K.Ya., and
Nikandrova, N.D.

PURPOSE: This book is intended for economists and economic statisticians.

COVERAGE: The compilation contains the most important figures (both absolute and
in percentages) on the economic and cultural development of Chelyabinsk Oblast
and the city of Chelyabinsk. The comparative figures are from 1941 or 1945,
and in some instance from 1950. The compilation does not contain the goals
aimed at by the current (Sixth) Five-Year Plan. The compilation was prepared
by the Chelyabinsk Statistical Office. All data (figures) for 1956 are

Card 1/16

Economy of the Chelyabinsk Oblast and the City of Chelyabinsk(Cont.) 926

preliminary, due to the fact that the compilation was sent to the press
in December 1956.

TABLE OF CONTENTS:

Territory and Population	13
Territory (as of 1956)	14
Population (estimated as of 1956)	14
Administrative territorial subdivision	15
Number of administrative-territorial units as of Jan. 1, 1957	17
Number of towns and urban settlements; number of inhabitants	17
Towns under Republic and Oblast jurisdiction	18
Distribution of towns and settlements according to the number of inhabitants	19
Urban population in the Oblast at the beginning of 1956	
Industries	
Production structure of Oblast industrial enterprises according to the form of jurisdiction	25
Number of industrial enterprises, as of 1955	25

Card 2/16

Economy of the Chelyabinsk Oblast and the City of Chelyabinsk (Cont.) 926

Grouping of Oblast processing industries by number of workers	26
Proportion of workers in individual branches of heavy industry	27
Coal output by coal fields in 1955	28
Building materials output by rayons in 1955	28
Growth of the physical volume of gross output for all industry for 1945, 1946, 1950, and 1955, as compared with 1940	30
Growth of the physical volume of gross output for all industry for 1951-1955 in percentages of 1950	31
Growth of industrial production in the city of Chelyabinsk in the Fourth and Fifth Five-Year Plans	33
Growth of output by machine-building and metalworking plants for 1951-55, in percentages of 1950	34
Industrial output in physical units for the entire Oblast for 1937, 1940, 1950, 1955, and 1956	35
Preliminary figures on the growth of the physical volume of the gross output for all industry for 1956 (in percentages of 1940, 1950, and 1955 figures)	37

Card 3/16

TITLE: Combat planning

SOURCE: Kommunist vooruzhennykh sil, no. 1, 1967, 48-55

TOPIC TAGS: military ^{operation} ~~action~~, military policy

ABSTRACT:

Under the conditions of modern war, the significance of the rocket- and nuclear-weapon capabilities sharply increases. The absence of this capability cannot be compensated by such other advantages as high morale and better combat training. These factors can tip the balance toward victory only in the presence of a rocket and nuclear capability. A new world war could only be a war of coalitions. The conduct of a military effort by many allied armies requires the large-scale planning of combined operations. The Socialist countries have tremendous advantages over the imperialist ones, and during WW II there was disagreement between the U.S., England, and France both before and during such operations. Planning under the conditions of a rocket- and nuclear-weapon capability requires not only the ability to correctly assess various techniques for utilizing equipment, but also a most thorough assessment of such factors as decoying, camouflaging, and

Card 1/2

UDC: none

ACC NR: AP7005922

achieving surprise. Determining the effects of attacks on the enemy is greatly complicated by troop dispersion, absence of a continuous front, and the rapid changing of the situation. Thus, it is possible to conclude that under modern conditions the requirements, significance, and scope of combat-operation planning are expanding while at the same time the maximum flexibility is required when changing plans and their individual elements in connection with a rapidly changing situation. Taking into account this contradiction between the established plan and the requirements of a changing situation is of particular importance in modern warfare. Any attempt to absolutize one or the other side of this contradiction leads to unhappy results. Under modern conditions a computation base is necessary, which may only be a means of high-speed control; this can include electronic computers, radar and infrared equipment, radio, radio-relay and wire communications.

SOV/2560

COVERAGE: The collection contains three scientific papers presented at a seminar on the theory of machines and mechanisms. The first paper deals with designing plane four-bar mechanisms, the second presents a method of designing governors for tractor diesel engines, and the third deals with the investigation of an inertia-type distributing device used in flour mill plansifters. The book also contains an author index for papers published in Volumes I-XIX, numbers 1-76, and a list of papers published in Volume XVIII of the Transactions of the Seminar on the Theory of Machines and Mechanisms.

TABLE OF CONTENTS:

Yasyulenis, A.I. Designing a Mechanism for a Given Trajectory or Given Positions Using an Auxiliary Mechanism With Two Degrees of Freedom 5

The author presents a method of synthesizing plane link mechanisms using a device representing the three-link mechanism with two degrees of freedom. He also derives relationships which simplify the solution of various problems in

Docent

TITLE: Design of flywheels without auxiliary graphs

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Mashino-
stroyeniye, no. 9, 1960, 83 - 94

TEXT: It is assumed that the graphs of kinetic energy of the machine, and of its reduced moment of inertia are known. The relationship between the force and position or speed is unimportant. The position of the axes of abscissae of above is determined in the course of solving the problem of flywheel. In addition to the two graphs, the following were specified: The average angular speed of the machine, ω_{av} and the coefficient of irregularity of rotation in the drive, δ . The reduced moment of inertia is $I_r = I_f + I_w$, where I_f is the inertia of flywheel, and I_w - that of the machine without flywheel. Therefore, I_r represents I_w when coordinates are

Card 1/3

S/145/60/000/009/009/017
D221/D304

Design of flywheels without ...

shifted, and it is assumed that it indicates E_f - the fictitious energy if the machine would be driven at $\omega_0 = \text{const}$. The author gives then the mathematical analysis of the proposed method. In order to eliminate drawing of curve I_w in two scales, an approximate procedure is proposed, which is based on the assumption of $\omega_0 = \omega_{av}$. The increased regularity of drive brings closer the curves of E_f at $\omega_0 = \omega_{min}$, and $\omega_0 = \omega_{max}$ to the line of E_f at $\omega_0 = \omega_{av}$. The analysis of these graphs demonstrates that when quantities of second order are neglected, then in the case of sinusoidal character of curves, the error is given by

$$\epsilon_e = 2\zeta\delta^2 e, \quad (14)$$

where e is the amplitude of curve of E , and ζ is a coefficient, that depends on the shift between E and E_f . This method can be applied to non-sinusoidal curves as well. The errors in the ordinates of the graphs are due to the relative error of calculation and to

Card 2/3

S/145/60/000/009/009/017
D221/D304

Design of flywheels without ...

the absolute error in tracing. The inaccuracy of the plot near the point of tangency introduces an error due to change in the angle of the tangent. The computed results are tabulated. To determine the coefficient δ it is necessary to plot the curve of E_f at $\omega_0 = \omega_{av}$ in two positions of contact with the curve of E , which allows measurement of e , etc. The author uses the stepped series of square root and obtains an equation that defines δ . The proposed variant of integral method involves less work than other procedures, except the method suggested by F. Radinger, but the latter is less precise in the case of modern high speed machines. A numerical example of application of this method is given. There are 5 figures 1 table and 8 references: 7 Soviet-bloc and 1 non-Soviet-bloc. ✓

ORG: ^{44,55}Lithuanian Agricultural Academy (Litovskaya sel'skokhozyaystvennaya akademiya)

TITLE: Matrix application to algebraic and some other operations with power series

SOURCE: Litovskiy matematicheskiy sbornik, v. 5, no. 1, 1965, 157-166

TOPIC TAGS: ^{16,44,55}mathematic matrix, matrix element, algebra, Fourier series, power series, matrix operation, SERIES

ABSTRACT: Matrix operations are applied to algebraic and other power series manipulations to obtain algorithms in matrix forms suitable for programming and inverse problem solutions. The power series representation

$$f(x) = \sum_{n=0}^{\infty} a_n x^n = (a) \cdot (x)$$

is written in the following matrix notation

$$f(x) = [a] \{x\} = \{x\} [a].$$

The following algebraic operations are discussed: multiplication of series

$$[c] = [a] [D(b)] = [b] [D(a)],$$

Card 1/3

L 8305-66

ACC NR: AT5027514

$$[D(b)] = \begin{bmatrix} b_0 & b_1 & b_2 & \dots \\ 0 & b_0 & b_1 & \dots \\ 0 & 0 & b_0 & \dots \\ \vdots & \vdots & \vdots & \ddots \end{bmatrix};$$

division of series

$$[w] = [a][D(b)]^{-1},$$

$$[D(b)]^{-1} = \begin{bmatrix} b_0^{-1} & -b_0^{-2}d_1 & \dots & (-1)^{n-1}b_0^{-n}d_{n-1} \\ 0 & b_0^{-1} & \dots & (-1)^{n-2}b_0^{-n+1}d_{n-2} \\ 0 & 0 & \dots & (-1)^{n-3}b_0^{-n+2}d_{n-3} \\ \vdots & \vdots & \vdots & \ddots \end{bmatrix};$$

raising to a power

$$[a^{(k)}] = [a][D(a)]^{-1}$$

where $1 \leq k \leq q-1$; negative power series; fractional power series, and series substitutions of the form

$$\psi(y) = \sum_{n=0}^{\infty} \beta_n y^n = [\beta](y^n),$$

$$y(x) = \sum_{n=0}^{\infty} \alpha_n x^n = [\alpha](x^n).$$

Each study is illustrated with several numerical examples. For a radius of convergence $R \geq 1$ trigonometric formulae are used to carry out the transformations $x = \cos \alpha$ and $x = \sin \alpha$. The matrix forms of series and polynomial transformations give algorithms

Card 2/3

L 8305-66

ACC NR: AT5027514

of simple inverse transformations. As an application, matrix operations are made with Chebyshev polynomials. Orig. art. has: 53 equations.

TITLE: Indirect method of determining thermodynamic [equilibrium] constants for
nitrosylation of amines and for formation of esters of nitric acid

SOURCE: Ukrainskiy khimicheskii zhurnal, v. 32, no. 1, 1966, 50-55

TOPIC TAGS: equilibrium constant, esterification, nitrogen compound, aniline,
organic nitroso compound

ABSTRACT: An indirect method of determining equilibrium constants for such reversi-
ble reactions as nitrosylation of aromatic amines and nitrous acid-alcohol interac-
tion (esterification) is presented. The method consists of measuring the equilibri-
um constant for tropeolin 00-nitrosylated tropeolin 00 in the presence of added
amines or alcohols (or other substances which interact with HNO_2). Experimentally,
the equilibrium was first determined for a solution containing $1 \cdot 10^{-5}$ moles/l

UDC: 541.122.3+547.551+547.261.4

Card 1/2

L 36880-66

ACC NR: AP6017652

tropeoline in 0.2 NH_2SO_4 -0.2 NNaCl - $4 \cdot 10^{-5}$ NNaNO_2 held for 1 hour at 20°C. This solution was then mixed with an equivoluminar solution of amine or alcohol and the new equilibrium nitrosotropeolin 00 concentration was determined colorimetrically. The equilibrium constants K_p determined by the indirect method for methylaniline, benzoaniline, benzyl-ortho-toluidine, aniline-acetaniline, methanitrometylaniline, diphenylamine, 4-chloro-2-aceto-amidodiphenylamine, and nitroso esters of methyl-, ethyl-, and isopropyl alcohols are tabulated. For the nitroso esters of alcohols a good agreement was found with the equilibrium data reported in the literature. It is claimed that the method may serve as an analytical tool in determination of concentrations of amines, alcohols, and other compound which react irreversibly with HNO_2 . Orig. art. has: 2 figures, 3 tables and 5 formulas.

TITLE: A critical case of stability of a stabilized motion according to Lyapunov

PERIODICAL: Akademiya nauk Kazakhskoy SSR. Vestnik, no. 7 (196), 1961, 99-104

TEXT: A study has been made of a system of three differential equations, whose characteristic equation in first approximation has a zero of third order. A group of solutions in first approximation is assumed to correspond to this zero. After some transformations the said system is written as $dx/dt = y$, $dy/dt = z$, $dz/dt = Z(x, y, z)$ (3). $Z(x, y, z)$ is expanded in a powers series of z : $Z(x, y, z) = f_0(x, y) + zf_1(x, y) + z^2f_2(x, y) + \dots$. If here $f_0(x, y) \equiv 0$, (3) will have an unstable particular solution: $x = c_1t + c_2$, $y = c_1$, $z = 0$. Therefore, the undisturbed motion determined by (3) is not stable in this case. If $f_0(x, y) \neq 0$ and

A critical case of stability of...

$f_c(x, y) = \psi_0(x) + y\psi_1(x) + y^2\psi_2(x) + \dots$, (3) will acquire the form
 $dx/dt = y$, $dy/dt = z$, $dz/dt = \psi_0(x) + y\psi_1(x) + y^2\psi_2(x) + \dots + z f_1(x, y)$
 $+ z^2 f_2(x, y) + \dots$ (4). The case with $\psi_0(x) \equiv 0$ is first examined next.

The following is assumed: $f_1(x, y) = \psi_0(x) + y\psi_1(x) + y^2\psi_2(x) + \dots$.
 The system to be investigated then reads: $dx/dt = y$, $dy/dt = z$,
 $dz/dt = y\psi_1(x) + y^2\psi_2(x) + \dots + z[\psi_0(x) + y\psi_1(x) + \dots] + z^2 f_2(x, y) + \dots$ (5).

Undisturbed motion is shown not to be stable if the series of $\psi_1(x)$ or
 $\psi_0(x)$ begin with odd powers, or with even powers the coefficients of which
 are positive. If the series of the same functions begin with even powers
 with nonpositive coefficients, two cases must be distinguished (since
 $\psi_1(x) \equiv 0$): 1, $\psi_1(c) < 0$ and $\psi_0(c) < 0$; 2, $\psi_1(c) < 0$ and $\psi_0(c) \equiv 0$; the
 undisturbed motion will be stable in both cases. The case is now examined
 where, in system (5), $\psi_1(x) \equiv 0$ and $\psi_0(x) \equiv 0$, and on the basis of theorem I
 [Abstractor's note: not given here] by G. V. Kamenkov (Ref. 2: Ob

A critical case of stability of...

ustoychivosti dvizheniya. Trudy KAI, 1939, no. 9) the undisturbed motion is shown not to be stable. The case is finally examined where, in system (4), $\varphi_0(x) \neq 0$. System (4) is transformed, and the inequality by Hurwitz is written:

$$-\psi_0(c) > 0, -\varphi'_0(c) > 0, \psi_0(c) \cdot \varphi_1(c) + \psi'_0(c) > 0 \quad (14).$$

In this case, the undisturbed motion expressed by (4) will not be stable if 1), the series of even only one of the functions $\psi_0(x)$, $\varphi'_0(x)$ begins with odd powers of x ; 2), the series of both functions $\psi_0(x)$, $\varphi'_0(x)$ begin with even powers, but the coefficient of even only one of them is positive with the lowest power of x ; 3) while the sum of the lowest powers of the series of $\psi_0(x)$ and $\varphi_1(x)$ is larger than the lowest power of the series of $\varphi_0(x)$ or is equal to it, the coefficients of the lowest powers of x are such that the sign of the last inequality in (14) changes. The undisturbed motion will be stable if the series of the functions $\psi_0(x)$ and $\varphi'_0(x)$ begin with even powers with negative coefficients and are such that the last inequality in (14) is satisfied with an arbitrary and

"Several Critical Cases of Stability of Solutions of Differential Equations in Normed Spaces", Izv. AN Kazakh. SSR, Ser. Astron., Fiz., Matem. i Mekhan., No 3, 1953, pp 3-40.

In the first section the author studies the stability of the solution $x = y = 0$ of a system of differential equations $\frac{dy}{dt} = f(t, x, y)$,

$\frac{dx}{dt} = F(t, x, y)$ whose right parts are abstract functions of some complete, linear, normed space E . In the second section the author investigates the effect of imposing certain conditions on the right-hand members of the equations. In the third section he discusses a complex equation involving limits. (RZhMat, No 1, 1955)

TITLE: On an investigation of one critical stability case 16 β

SOURCE: AN KazSSR. Izvestiya. Seriya fiziko-matematicheskikh nauk, no. 2, 1964, 3-7

TOPIC TAGS: differential equation, stability condition

ABSTRACT: It is shown that the behavior of each term in the right side of the equation

$$\frac{dx}{dt} = y, \frac{dy}{dt} = z, \frac{dz}{dt} = F(x, y, z) = f_0(x, y) + z f_1(x, y) + \dots, \quad (1)$$

to which a stationary system of three differential equations with a characteristic equation having a zero root can be reduced by a stability-conserving transformation, affects the stability of the system

Card 1/3

L 17685-65

ACCESSION NR: AP4049394

as a whole. This is done by introducing the transformation

$$y = y_1 [1 + Y(x, y)] = y_1 [1 + \theta_0(x) + y_1 \theta_1(x) + \dots]$$

$$z = z_1 [1 + Z(x, y_1, z_1)] \left(1 + Y(x, y_1) + y_1 \frac{\partial Y}{\partial y_1} \right) + y_1^2 (1 + Y) \frac{\partial Y}{\partial y}, \quad (2)$$

where $Y(x, y_1)$ and $Z(x, y_1, z_1)$ are holomorphic functions of their arguments, vanishing with zero arguments. The system (1) then transforms into a system in which solution-possessing equations can be written for the functions Y and Z . Several theorems concerning the stability of the initial system are then proved. Orig. art. has: 11 formulas.

SUBJECT USSR/MATHEMATICS/Differential equations CARD 1/3 PG - 481
 AUTHOR JATAJEV M.
 TITLE On a countable system of differential equations in the L_p .
 PERIODICAL Izvestija Akad.Nauk Kazach.SSR 41 (8), 12-23 (1956)
 reviewed 1/1957

The author considers the countable system of differential equations

$$(1) \quad \frac{dx_s}{dt} = \omega_s(t, x_1, x_2, \dots) \quad (s=1, 2, \dots).$$

Here $t \geq 0$ is the independent real variable and the functions $x_s = x_s(t, \varphi)$ are sought which for every fixed value $t = t_0$ relative to φ of the interval $[\alpha, \beta]$ belong to the function class of L_p . It is proved that under certain assumptions on the continuity of the ω_s and by satisfaction of the Cauchy-Lipschitz condition by ω_s the system (1) possesses a unique equicontinuous solution $x_s = x_s(t, \varphi)$ ($s=1, 2, \dots$) which assumes the values $x_s = x_s^0(\varphi)$ for all t of $t_0 + h \geq t \geq t_0$. For h an upper bound is given.

Further it is shown that the second (direct) Liapunov method of the examination of stability can easily be extended to countable systems in the L_p . For the

Izvestija Akad.Nauk Kazach.SSR 4, (8), 12-23 (1956) CARD 2/3 PG - 481

considered case the author gives formulations of the notions Liapunov function, system of first approximation, characteristic number etc. A critical case of stability is considered: Let be given the system:

$$(2) \quad \frac{dx_s}{dt} = \sum_{k=1}^{\infty} a_{sk}(t)x_k + L_s(t, x_1, \dots, y_1, \dots)$$

$$\frac{dy_j}{dt} = \sum_{k=1}^{\infty} b_{jk}(t)y_k + \sum_{k=1}^{\infty} \omega_{jk}(t)x_k + N_j(t, x_1, \dots, y_1, \dots)$$

(s=1, 2, ...), (j=1, 2, ...),

where the following conditions are satisfied in $g(t \geq 0, |x_s| < R, |y_j| < R)$:

1. $a_{sk}(t)$, $b_{jk}(t)$ and $\omega_{jk}(t)$ are equicontinuous in t ; 2. $\sum_{k=1}^{\infty} |\omega_{jk}(t)| \leq \omega_j(t) \leq \omega$;

3. Every bounded and equicontinuous solution of $\frac{dx_s}{dt} = \sum_{k=1}^{\infty} a_{sk}(t)x_k$ (s=1, 2, ...)

satisfies the inequation $\|x_s(t, \varphi)\| \leq \|x_s(t_0, \varphi)\| \cdot B e^{-\alpha(t-t_0)}$ for all

Izvestija Akad.Nauk Kazach,SSR 4, (8), 12-23 (1956) CARD 3/3 PG - 481

$t \geq t_0 \geq 0$, $B > 1$, $\alpha > 0$ - constants. 4. Every bounded and equicontinuous solution of $\frac{dy_j}{dt} = \sum_{k=1}^{\infty} b_{jk}(t) y_k$ ($j=1,2,\dots$) satisfies the inequation

$\|y_j(t, \varphi)\| \leq \|y_j(t_0, \varphi)\| \cdot P(t-t_0)$ for all $t_0 \geq t \geq 0$ and $P(t_0-t)$ - a polynomial with positive coefficients which do not depend on t_0 and φ ; 5. $|L_g(t, x'_1, \dots, y'_1) - L_g(t, x''_1, \dots, y''_1, \dots)| \leq A u^{1+\delta} \Delta u$; $|N_j(t, x'_1, \dots, y'_1, \dots) - N_j(t, x''_1, \dots, y''_1, \dots)| \leq A u^{1+\delta} \Delta u$, where A and δ are constants and $u = \sup \{|x'_g|, |y'_j|, |x''_g|, |y''_j|\}$,

$\Delta u = \sup \{|x'_g - x''_g|, |y'_g - y''_g|\}$. If the conditions 1-5 are satisfied, then the trivial solution $x_1 = x_2 = \dots = y_1 = y_2 = \dots = 0$ of (2) is conditionally stable. The initial conditions can be given arbitrarily but must only be sufficiently small. This conditional stability is uniform and asymptotic.
